Darkside Subscriptions

A workspace for recurring subscriptions, billing, and customer self-service.

Project purpose

Darkside brings recurring customer work into one shared workspace.

The challenge

Subscription work spans product and plan setup, customer agreements, invoices, payments, and renewals. Teams need a clear view of how those records connect.

The project goal

Give staff tools to manage the subscription lifecycle and give customers a simple place to review their own account activity.

Core capabilities

The platform supports the work from offer setup through renewal.

01

Catalog and plans

Manage products, variants, plans, taxes, discounts, and quotation templates.

02

Subscription operations

Move agreements from draft and quotation to confirmed, active, or closed. Apply plan rules to pause, renew, cancel, or change a plan.

03

Billing and payments

Generate invoices, track partial payments and overdue balances, download PDFs, and optionally use Razorpay checkout.

04

Reporting and activity

Review revenue and MRR, export reports to CSV, and follow notifications and audit history.

Subscription workflow

Each stage builds on the records created in the previous stage.

01

Set the offer

Configure products, plans, tax rules, and quotation templates.

02

Start the agreement

Create a subscription and prepare it for customer confirmation.

03

Bill and collect

Generate invoices, record payments, and track balances.

04

Manage renewals

Review status and use customer actions permitted by the plan.

Users and access

Each role sees the tools and records needed for its work.

Admins and staff

Maintain the catalog and manage customers, quotations, subscriptions, invoices, payments, and reports. Admins also manage team access and workspace settings.

Customers

View personal subscriptions, invoices, payment history, and notifications. Pause, resume, renew, cancel, or schedule a plan change when the plan allows it.

Access controls The API checks roles and customer ownership. Refresh sessions use HTTP-only cookies.

Technology and deployment

The browser app uses an API to store and retrieve subscription records.

Frontend

React 18 and Vite provide the responsive web interface.

API

Node.js and Express handle authentication, business rules, and reports.

Database

Prisma connects the API to PostgreSQL. PGlite supports local development.

Optional services

SMTP can deliver email. Razorpay can handle online checkout. Production hosting needs a managed PostgreSQL database and environment secrets.
